

FITS HRMS

A Human Resource System built for Omani rules

Internship Presentation & Speaker Script (Easy English)

Role: Full Stack Generative AI Intern

Company: FITS — FIRST Information Technology

Location: Muscat, Oman (Remote)

Presented by: [Your Name]

Italic text is what you say out loud. Bold labels are your cues.

SLIDE 1

Introduction

SAY:

"Good morning everyone. My name is [Your Name], and during my internship as a Full Stack Generative AI Intern at FITS — FIRST Information Technology, based in Muscat, Oman, which I worked on remotely, I worked on FITS HRMS — a Human Resource Management System built to follow Oman's labour laws."

SLIDE 2

The Problem

SAY:

"Human resource management in Oman has two real problems. First, hiring is a long manual process — job requests, many levels of approval, interviews, and offer letters are all handled over email and paper, and there is no proper record of who did what. Second, Oman has special rules that companies must follow: they must calculate end-of-service pay (called gratuity), create a special salary file for the government (called WPS), and connect to the bank system to pay salaries. Normal HR tools do not handle these. So we needed one system that does the full hiring journey and also follows all the Omani rules."

SLIDE 3

My Objectives

SAY:

"During the internship my work focused on four objectives."

- Build end-to-end recruitment — from taking in a candidate all the way to onboarding, with multi-level approvals.
- Add Generative AI features — AI-assisted CV screening and job-description writing.
- Add digital signatures on proposals and offer letters using DocuSign and Adobe Sign.
- Support Omani rules — gratuity, the WPS file, and bank payments — on a safe system where each company's data stays private.

SLIDE 4

The Hiring Flow (I'll show this live in the UI)

SAY:

"The main part of the system is the hiring flow. It has different stages, and I will explain each one while I go through the website."

ON SCREEN (the stages):

- **Candidate Intake** — upload CVs and add candidates.
- **Manpower Request & Approvals** — a department asks to hire, and managers approve in order.
- **Interviews & Evaluation** — schedule interview rounds and score the candidate.
- **Proposal & E-Sign** — create the job proposal and get digital signatures.
- **Offer Letter & Onboarding** — send the final offer and start onboarding.

SAY:

"I will explain all of these in detail when I open the website. For now, let me talk about the part I worked on the most — the Generative AI."

SLIDE 5

Generative AI — My Main Work (Overview)

SAY:

"As a Generative AI intern, the main part of my work was adding AI into the hiring flow. I built two AI features. The first one writes job descriptions for the company, and the second one reads and checks the CVs that candidates upload. Let me explain both."

ON SCREEN:

- **1. AI Job Description** — the company gives a few inputs, the AI writes the full job description.
- **2. AI CV Screening** — a candidate uploads a CV, the AI reads it, scores it against the job, and auto-shortlists the good ones.

SLIDE 6

Feature 1 — AI Job Description

SAY:

"The first feature is the AI Job Description writer. Normally, writing a good job description takes time. With this feature, the company only enters a few simple inputs — for example the job title, the skills they want, and the experience needed. The AI then takes these inputs and writes a full, clean, professional job description for them in seconds. So instead of writing the whole thing by hand, they just give a few points and the AI does the rest."

IN SHORT:

Enter a few inputs → AI writes the complete job description.

SLIDE 7

Feature 2 — AI CV Screening

SAY:

"The second feature is AI CV Screening, and this is the bigger one. When a candidate applies, they upload their CV or resume. The AI then does three things automatically. First, it reads and extracts the important details from the CV — like the person's experience, skills, and qualifications — so we don't have to type anything by hand. Second, it checks the candidate against the job and gives them a score for how well they fit. Third, if the score is above a limit we set, the system automatically shortlists that candidate. So out of hundreds of CVs, the recruiter instantly sees the best people, which saves a huge amount of time."

IN SHORT (the three steps):

- **Extract** — reads the CV and pulls out experience, skills, and qualifications.
- **Evaluate** — scores how well the candidate fits the job.
- **Auto-shortlist** — if the score is high enough, it shortlists them automatically.

SLIDE 8

How I Built the AI (Trying Different Models)

SAY:

"Building the AI was a step-by-step journey. At first I used the Llama model to read CVs and write job descriptions, and it worked, but I wanted faster and better answers. So next I tried Groq, which was much faster. After that I kept testing other models in the same way to compare the results and pick the best one for each task. This is the normal way you build AI features — you try one model, see how good it is, then try another, until you get the answers you want. Because I kept the model behind a simple setting, switching from one model to another was easy and did not break the rest of the system."

ON SCREEN (the journey):

- Started with **Llama** — first working version
 - Moved to **Groq** — faster answers
 - Kept testing more models — to compare and pick the best
 - Easy to switch models, because they sit behind one setting
-

CLOSING — TRANSITION TO CODE

"So that is the idea behind the system and the AI work I did. Now I will show the code, and after that I will open the website and walk you through the full hiring flow."

NEXT STEPS (after the slides):

1. Show the code — open the project, point to the apps, the recruitment models, and the AI screening part.
2. Website walkthrough — open the running site and explain each hiring stage live, following one candidate from CV to signed offer.
